

Technical innovation for a luminescent square

(Limoges, France)

In the heart of the city, In Situ landscape designers creates a large carpet of «porcelain concrete» that we inlay with phosphorescent material. The square restores the energy accumulated during the day, to light up at nightfall. The whole square is based on the theme of ceramics, including the lighting poles. The project is part of an overall lighting plan that we have developed in order to coordinate this part of the city with the city centre.
