

## lighting design for the Haguenau train station's surroundings (Haguenau, France)

Illumination of roads and public spaces of the multimodal hub at Haguenau station. Light defines the spaces and adapts to different uses, whether functional or more identity related, while maintaining a global and coherent logic. The street lighting furniture contributes to the identity of this centre (high-rise, design) and marks it out as a singular space in the city. It becomes a signal element in the image of this attractive location. The lighting also adapts to

the scale of the pedestrian and soft modes, covered with warm light and lit by smaller poles. The Passe-Quartier footbridge, which has already been built, offers warm functional lighting with a discreet highlighting of its architecture in a blue hue. © Adrien Michel
