

## Custom-made colomns

(Lyon, France)

On the high terraces of the shopping center, we designed an element that identifies the project: cylindrical columns, 4.50m high. These small poles incorporate a series of light points directed towards the ground for general lighting as well as to highlight certain specific points (reading light on a bench for example). Due to the thinness of the slab, these poles are placed

on special extra-flat bases. This lighting is dimmable for adjustments and for security standby levels, after the center is closed.
