

Skypark Building at Luxembourg Airport (Luxembourg)

Skypark is a project that is an immediate extension of Luxembourg Airport, providing it with new functions: restaurants, shops, offices, hotel, co-working spaces, underground car park, green terraces, etc. The lighting project covers all interior and exterior spaces, but also the illumination of the façades. A slow wave of light iridescences the copper skin of the building, playing on

the curves created by the façades. For this ambitious, resolutely innovative project, we are developing a very low-voltage lighting system (POE), allowing for great management flexibility and savings in both maintenance and energy.
