

## Restructuring of an offices building

(Paris, France)

The reconfiguration of the Avant-Seine building is an opportunity to structure its night vision to make it a space open to the outside world, enhancing and communicating its internal functions. The lighting accompanies the scenography of the main spaces, designed by the Gensler architectural firm: the Canopy, the Atrium with its grand staircase and meeting alcoves, and the central usage volume on the façade. The lighting of the offices

is designed not to dazzle, but to create the feeling of an illuminated space without it being clear where the light is coming from. This building also lives with natural light. We therefore developed a «Human Centric Lighting» approach to ensure that the building is in tune with day and night time and offers optimal lighting comfort.
