

## le Flût, a bridge above the Saône for the Lyon West Express Tramway

(Lyon, France)

The new bridge across the Saône takes the gentlest approach possible regarding the river and the hill, to respect the wild and untouched nature of the river and the right bank, which becomes accessible for pedestrians. From the structure, only a thin horizontal line of light, highlighting the concave upstream and downstream edges of the deck, is reflected in the Saône. Small light

points inserted into the guardrail's rods eliminates any light loss toward the water. A lighting fixture mounted on LAC poles offers an optimal lighting for circulations. On the hill, the lighting project preserves the tranquility of the hill with discreet fixtures integrated into thin tubular columns, preventing any disruption of the existing landscape. © HISM & OMA
